习题 3.5 (A)

$$3. (2) f(x) = |(x-1)(x-2)|$$

$$f(x)_{\max} = \max\left\{f\left(\frac{3}{2}\right), f(-10)\right\}$$

$$= f(-10) = 132$$

$$(4) f'(x) = nx^{n-1}(1-x)^m - mx^n(1-x)^{m-1}$$

$$= x^{n-1}(1-x)^{m-1} [n(1-x) - mx]$$

$$= x^{n-1}(1-x)^{m-1} [-(m+n)x + n]$$

$$\text{记 } g(x) = -(m+n)x + n, x \in [0, 1]$$

$$\text{显然 } g(x) \downarrow \quad \text{且 } g(0) = n > 0 \quad g(1) = -m < 0$$

$$\therefore \text{令 } g(x_0) = 0 \text{ 解得 } x_0 = \frac{n}{m+n}$$

$$\therefore f(x)_{\max} = f(x_0) = \left(\frac{n}{m+n}\right)^n \left(\frac{m}{m+n}\right)^m$$

$$(6) f(x) = -x^2 \ln x \quad f'(x) = -2x \ln x - x$$

$$= -x(2 \ln x + 1)$$

$$\therefore f(x)_{\max} = f(e^{-\frac{1}{2}})$$

$$= e^{-1} \times \frac{1}{2} = \frac{1}{2e}$$

$$7. f'(x) = 3x^2 - 3 = 3(x+1)(x-1) \leq 0$$

$$\therefore f(x) \text{ 在 } [0, 1] \text{ 上 } \downarrow$$

$$\therefore f(x) \text{ 在 } [0, 1] \text{ 上不可能有两个根}$$

$$8. \text{ 记 } \varphi(x) = f(x) - x$$

$$\therefore \varphi(0) \cdot \varphi(1) = f(0) \cdot [f(1) - 1] < 0$$

$$\therefore \exists x_0 \in (0, 1), \Rightarrow \varphi(x_0) = 0$$

$$\varphi'(x) = f'(x) - 1 \quad \therefore \forall x \in (0, 1), \varphi'(x) \neq 0$$

$$\varphi'(x) = f'(x) - 1 \quad \therefore \forall x \in (0,1), \varphi'(x) \neq 0$$

即 $\varphi'(x)$ 在 $(0,1)$ 上没有根

因此 $\varphi'(x)$ 在 $(0,1)$ 上恒大于 0 或恒小于 0

$\therefore \varphi(x)$ 在 $(0,1)$ 上单调

综上 存在唯一的一个数 $x_0 \in (0,1)$, $\Rightarrow f(x_0) = x_0$

Q.E.D

11. 取 $g(x) = x^2$, 由柯西中值定理可知:

$$\exists \xi \in (a,b), \Rightarrow \frac{f(b)-f(a)}{g(b)-g(a)} = \frac{f'(\xi)}{g'(\xi)}$$

$$\text{即 } \frac{f(b)-f(a)}{b^2-a^2} = \frac{f'(\xi)}{2\xi}$$

$$\text{整理得 } 2\xi[f(b)-f(a)] = (b^2-a^2)f'(\xi)$$

12. 取 $g(x) = \frac{f(x)}{x}$, $h(x) = \frac{1}{x}$

由柯西中值定理可知:

$$\exists \xi \in (a,b), \Rightarrow \frac{g(b)-g(a)}{h(b)-h(a)} = \frac{g'(\xi)}{h'(\xi)}$$

$$\text{即 } \frac{\frac{f(b)}{b} - \frac{f(a)}{a}}{\frac{1}{b} - \frac{1}{a}} = \frac{\frac{f(\xi) \cdot \xi - f(\xi)}{\xi^2}}{-\frac{1}{\xi^2}}$$

$$\text{整理得 } \frac{af(b)-bf(a)}{a-b} = f(\xi) - \xi f'(\xi)$$
